

OTTO User manual

Authors: Mikael Malmqvist & Simon Nielsen

Introduction

OTTO - Onroad Time Tracking Optimizer, is an app aimed for you as a truck driver. It keeps track of the time you have driven, all of your breaks and rests according to the driver regulations established by the European Union.

Within the app you're able to set your final destination and as many checkpoints as you desire for your route. If none is set and your route requires one in order not to violate any regulations, OTTO will simply set an appropriate checkpoint for you. Easy as that!

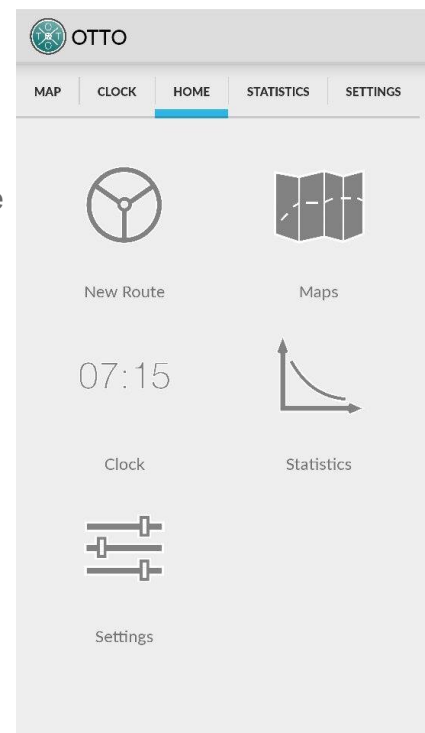

When done customizing your route OTTO will optimize it and propose any recommended rest stops/checkpoints along the way. Since the user interface has been customized for a safe user experience while driving you will quickly get the hang of it.

This guide will learn you more about what specific features OTTO has to offer and how to use them.

A quick overview

The application consists of five different tabs: Map, Clock, Home, Statistics and Settings.

When entering the app you are greeted with the Home tab. At this point you can set a new route or quickly access any of the other tabs within the application with the corresponding icons. You can also choose to swipe to another tab, if you are more comfortable with that.

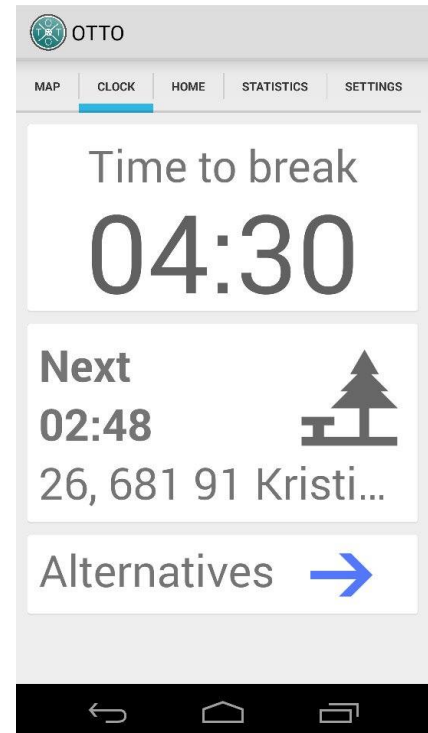

Clock

As you swipe to the Clock tab the only thing you can see is how long you have left to drive or how long until you are allowed to drive depending on your driving history. The application gets input from the tachograph installed in the truck. This means as a truck driver, you do not have to change any of your current daily routines. You still tell the tachograph if you are working, driving or resting, just as you normally would.

When you have set a new route as explained below the view of the clock will change a bit. You will now see the next stop on your route and how long it will take to get there. The name or address of the place will show up as well as a picture of what type of stop it is.

The alternatives button is explained further in the section “Change stop”

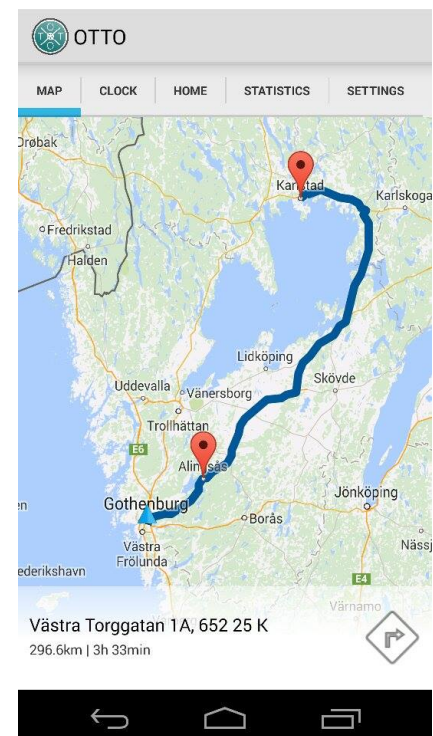

Map

When entering the Map tab for the first time you will be prompted with an empty map displaying your current position. You will be able to navigate around it the map, using the standard pinch-to-zoom motions panning around the world by simply dragging your finger along the map. Please Note that this only is possible while not driving because of security reasons. When driving you will instead have a restricted view as you will enter “Driving Mode”. Which also means that the camera will follow the current position.

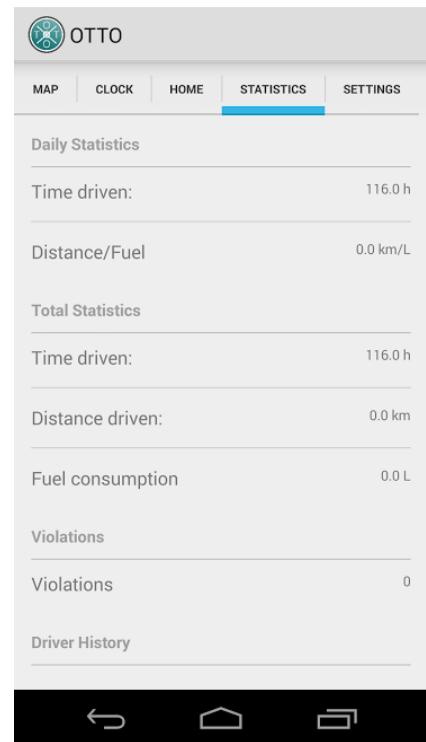

You can manually start following the camera by simply clicking the icon in the right hand corner of the screen. *(if a route is set)*

Whenever a route is set you'll be able to view it from within the Map as well as tap the different locations (i.e the final destinations and checkpoints) for more information about them.

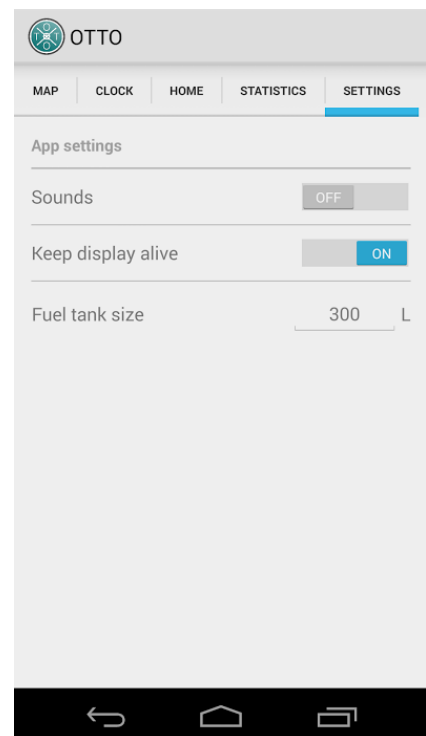

Statistics

In the Statistics tab you are able to view useful statistics about how you have driven so far. You can also review your sessions (e.g 141002 Driving 2h, 23 min, 0 Violations).

Settings

From within the Settings tabs you can in a safe way change the settings for how the system sound and display should behave, as well as setting the size of the fuel tank (in liters).

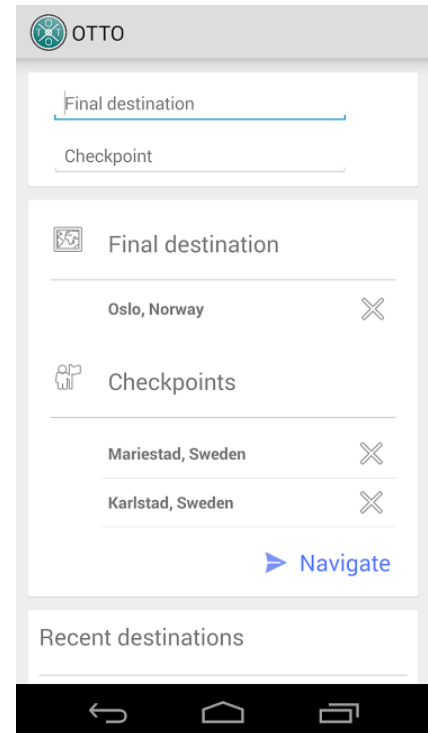

Setting a new route

When setting a new route there are two things to keep track of: your final destination and your checkpoints. The final destination is, as the name suggests, the final destination of your new route. This is required in order to set a new route.

It is furthermore alternative to add any checkpoints to the route. When adding these they will appear in a list below the Checkpoints headline based on what order you added them.

To remove a checkpoint or the final destination from the list it is as simple as tapping the cross-icon to the rear right of the location.

You will not have to add any “From”-locations to your route, instead OTTO will automatically use your current location when calculating the route.

Change stop

If you have a route set and go to the clock tab you will as mentioned before see your time left to drive until the next stop, information about the next stop and the alternatives button.

Clicking on said button will take you to the alternative stops section as shown in the picture. Here you are presented with one to three alternative stops. If you click on any of them the route will update with your chosen stop as the next stop.
